What is an Angular Component?

A component is a building block of an Angular app. It controls a part of the screen (UI) and includes HTML, CSS, and TypeScript logic.

What is an Angular Module?

A module is a container that groups related components, services, and other code. The main module is usually AppModule.

What is Standalone component?

A standalone component works without being declared in a module. It can import what it needs directly and is useful for simpler, more modular code.

What is feature module?

A feature module is used to organize related functionality (like user or admin sections) into separate modules, making large apps easier to manage and scale.
